

CALIFORNIA POPULATION CONTINUES SLOW GROWTH
ACCORDING TO NEW STATE DEMOGRAPHIC REPORT

FOR IMMEDIATE RELEASE:
December 6, 2011

CONTACT: Linda Gage (916) 323-4086
H.D. Palmer (916) 323-0648

SACRAMENTO – California's population grew less than one percent between July 1, 2010 and July 1, 2011 to total more than 37.5 million persons, according to official population estimates released today by the Department of Finance. This represents 260,000 new residents during the fiscal year and continues the pattern of modest growth rates over the past few years. The current growth rate of 0.70 percent is a slight increase over last year's growth of 0.65 percent.

As in the last decade, natural increase remains the primary source of the state's growth. The natural increase of 283,000 in the past year is composed of roughly 511,000 births minus 228,000 deaths. This accounted for all of the 2010-11 fiscal year growth. Net outmigration reduced the population by 22,000 residents. Net migration includes all legal and unauthorized foreign immigrants, residents who left the state to live abroad, and the balance of hundreds of thousands of people moving within the United States both to and from California. During the fiscal year, the state gained about 132,000 new foreign immigrants and lost 154,000 domestic migrants to other states. This is similar to the annual net domestic outmigration of the prior five years during which California experienced losses exceeding 100,000 persons to other states.

Since the national census on April 1, 2010, the state has grown by 325,000 persons. The July 1, 2011 population estimates are benchmarked to the 2010 Census. In general, estimates become less precise as the time from the last census increases. Some Census 2010 results were first incorporated in the January 1, 2011 population estimates published in May 2011. The population estimates for July 2000 through 2010 have now been aligned with the two most recent censuses.

Highlights of the July 1, 2011 county population report include:

- ❑ California has 58 counties. County population totals range from 1,109 persons in Alpine, the least populated county, to over 9.8 million persons in Los Angeles, the state's most populous county.
- ❑ The state's nine largest counties, Los Angeles, San Diego, Orange, Riverside, San Bernardino, Santa Clara, Alameda, Sacramento and Contra Costa each have over one million residents. They are home to 70 percent of Californians.
- ❑ Riverside, Los Angeles, Orange, San Diego, and San Bernardino counties posted the highest numeric population gains and account for over half of the state's growth. Growth in these counties was primarily due to natural increase. Los Angeles County experienced net out-migration.
- ❑ Riverside, Imperial, Placer, Tulare, Santa Clara, and San Bernardino counties had the largest percentage increases in population, each growing more than one percent. Population change ranged from the highest growth rate of 1.59 percent in Riverside to a negative 3.31 percent in Alpine.

- ❑ Most counties gained population but 18 counties experienced population decline.
- ❑ Natural increase was the primary source of growth in the state and for 37 of the counties that had population growth. Eleven counties experienced natural decrease (more deaths than births during the year) – Alpine, Amador, Calaveras, Lake, Mariposa, Nevada, Plumas, Sierra, Siskiyou, Trinity, and Tuolumne.
- ❑ Net migration was the primary source of growth in 3 counties – Napa, Placer, and San Francisco
- ❑ Like the state, two-thirds of the counties experienced net out-migration (more people moving out of the county than moving in).
- ❑ Twenty counties had a higher growth rate than the state, another 20 had a lower growth rate, while the remaining 18 posted declines.

Population estimates produced by the Department of Finance are mandated in the State Constitution and various codes. They are used by state agencies, California counties, academic institutions, private research organizations, the media, and the public. Primary uses include budgeting, needs assessment, program planning and evaluation, distribution of State funds, and the calculation of rates (such as birth, death, college-going, and incarceration).

Population estimates are made using aggregate data from a variety of sources, including birth and death counts provided by the Department of Public Health, number of driver's licenses and driver's license address change data from the Department of Motor Vehicles, housing unit data from local governments, school enrollment data from the Department of Education, and federal income tax return data from the U.S. Internal Revenue Service. These statistical reports of administrative records do not disclose any information about individuals.

County ranking tables, maps, and the E-2 (*California County Population Estimates and Components of Change by Year, July 1, 2010-2011*) methodology and data tables are included. The E-2 and companion reports E-6 (*Population Estimates and Components of Change by County, July 1, 2010-2011*) and E-7 (*California Population Estimates, with Components of Change and Crude Rates, July 1, 1900-2011*), and thematic maps as well as revised estimates between 2000 and 2010 are on the Department's website:

E-2. California County Population Estimates and Components of Change by Year — July 1, 2010-2011

December 2011

OFFICIAL STATE ESTIMATES

Acknowledgments

Linda Gage produced the state and county estimates and prepared this report. Melanie Martindale produced the birth projections. Douglas Kuczynski collected and prepared the group quarters data. Evaon Schnagl produced the school enrollment projections, prepared the driver's license address change data, and validated input data, formulas and methodologies used in the current state and county estimates series.

Suggested Citation

Contents

This report presents preliminary state and county population estimates for July 1, 2011, revised estimates for July 1, 2010, and components of population change.

Highlights

California's population grew less than one percent between July 1, 2010 and July 1, 2011 according to official population estimates released today by the State Department of Finance. This represents 260,000 new residents during the fiscal year and continues the pattern of modest growth rates over the past few years. The current growth rate of 0.70 percent is a slight increase over last year's growth of 0.65 percent.

As in the last decade, natural increase remains the primary source of the state's growth. The natural increase of 283,000 in the past year is composed of roughly 511,000 births minus 228,000 deaths. This accounted for all of the 2010-11 fiscal year growth. Net outmigration reduced the population by 22,000 residents. Net migration includes all legal and unauthorized foreign immigrants, residents who left the state to live abroad, and the balance of hundreds of thousands of people moving within the United States both to and from California. During the fiscal year, the state gained about 132,000 new foreign immigrants and lost 154,000 domestic migrants to other states. This is similar to the annual net domestic outmigration of the prior five years during which California experienced losses exceeding 100,000 persons to other states.

Since the national census on April 1, 2010, the state has grown by 325,000 persons. The July 1, 2011 population estimates are benchmarked to the 2010 Census.

Methodology

The state and county populations are independently estimated using population change models benchmarked on official decennial census counts. The state population is estimated using the Driver License Address Change method. County population proportions are estimated using the

average of three separately estimated sets of proportions. The final distribution of proportions is applied to the independently estimated state control.

State Estimate. The state population is estimated using the Driver License Address Change (DLAC) Method. This composite method separately estimates the population under age 18, 18 through 64, and 65 years and older. Administrative records such as births, deaths, driver license address changes, tax return data, Medicare and Medi-Cal enrollment, immigration reports, elementary school enrollments, and group quarters population are among the data used in this method. All data are in summary tables and do not reveal the identity of any individual.

County Estimates. County population proportions result from averaging three methods.

DLAC Method. A modified version of the state Driver License Address Change (DLAC) method is used for counties. County proportions of the state total result from changes in county population values for births, deaths, school enrollment, foreign and domestic migration, medical aid enrollments, and group quarters population.

Ratio-Correlation Method. This method models change in household population as a function of changes in the distributions of driver licenses, school enrollments, housing units, and deaths. Estimates of county group quarters are added.

Tax Return Method. County proportions are derived by the U.S. Census Bureau using matched federal income tax returns to estimate inter-county migration along with vital statistics, group quarters, and other information for the population aged 65 and over.

Data Considerations

Sources. Data used in estimation models come from administrative records of 17 state and federal departments and agencies. Timeliness and coverage in these series vary. Corrections, adjustments or estimates may be made while preparing the estimates.

Accuracy. In general, estimates become less precise as the time from the last census increases. Data and models used to produce population estimates are subject to both measurement and nonmeasurement errors. This results in imperfect correlation between the data used to estimate the population and actual population change. The data and estimating models have been thoroughly tested with decennial census results that provide benchmarks for the estimates series. Data and methods are further refined and modified throughout the decade.
